

an implementation without surprises **StartReady Lync — UC SCAN**

Installing and implementing Microsoft Lync normally is a time-consuming, costly and technically complex task. With the StartReady Appliance a lot of these complexities are already taken care of.

Every organization though has its own ICT and network infrastructure specifics that can influence the wishes and demands they have for a Lync solution. StartReady offers in this phase of the implementation the security that organizations need.

UC SCAN

In the StartReady UC Scan the business goals of the organization are matched with the technical feasibility of functions that will become available when Lync is implemented. So, by opting for Presence, Instant Messaging, LiveMeeting or telephony, the corresponding IT infrastructure will be checked.

During the UC SCAN the following subjects will be touched:

- **Server Scan:** IT technical feasibility of Microsoft Lync, with special attention for DNS, Domains, Certificates and Firewalls;
- **Licensing Scan:** the necessary Microsoft Licenses related to the selected workloads;
- **Workplace Scan:** Client implementation (Citrix/Virtualisation/Desktop Management);
- **Telephony Scan:** Integrated or standalone implementation of Enterprise Voice. When integrated: impact analysis for existing PBX + associated potential costs;
- **Devices Scan:** Employees perspective for handsets, headsets and video support;
- **Network Scan:** bandwidth analysis for the offices and/or home workplaces;
- **Mobility Scan:** de role of SmartPhones within the organization .

The output of the scan is that the customer will have the certainty about the features that can be offered on the existing infrastructure, or what needs to be addressed before the implementation can start.
